Interview:

10. Applicant's Attorney Jordan M. Becker, Reg.No. 39,602 is thanked for the telephone interview on 14 November 2006. During that telephone interview Jordan M. Becker granted authorization to ***amend claims 48-49 status*** from "***Currently amended***" to "***Previously presented***"; also canceling ***claims 13 through 19***.

EXAMINER'S AMENDMENT

11. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it ***MUST*** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Applicant's Jordan M. Becker, Reg.No. 39,602 on 14 November 2006.

48. (~~Currently amended~~ Previously presented) A storage server as recited in claim 39, wherein the memory further contains code which, when executed by the processor, causes the data storage server to execute a third process, said third process comprising:

saving an uncompressed version of the portion of the set of data in a memory in the data storage system after said compressing; and

in response to a subsequent read on the portion of the set of data, using the uncompressed version from the memory to fulfill the request, without decompressing the portion of the set of data.

Art Unit: 2166

49. (~~Currently amended~~ Previously presented) A storage server as recited in claim 39, wherein the memory further contains code which, when executed by the processor, causes the data storage server to execute a third process, said third process comprising:

receiving a read request;

in response to the read request, determining that the read request relates to at least one subset of the set of data;

scanning the compression group to determine whether any entry in the compression group contains the predetermined value; and

upon detecting the predetermined value in any of the entries in the compression group, immediately beginning decompression of the set of data.

In the Title:

Pursuant to MPEP 606.01 the Title is changed to read

--IN A DATA STORAGE SERVER, FOR EACH SUBSETS WHICH DOES NOT CONTAIN COMPRESSED DATA AFTER THE COMPRESSION, A PREDETERMINED VALUE IS STORED IN THE CORRESPONDING ENTRY OF THE CORRESPONDING COMPRESSION GROUP TO INDICATE THAT CORRESPONDING DATA IS COMPRESSED--

Reasons for allowance

Claims **1-10,20-30,33-49** are allowed

The following is an examiner's statement of reasons for indication of allowable subject matter: The prior art of record does not disclose, make obvious, or otherwise suggest the structure of the applicant's *"for each of the subsets which does not contain compressed data after said compressing, storing a predetermined value in the corresponding entry of the compression group, the predetermined value being indicative that corresponding data is compressed, in claim 1,39;*

"for each of the number of consecutive blocks which does not contain compressed data after said compressing, storing a predetermined block number in the corresponding entry of the compression group, the predetermined block number being indicative that corresponding data is compressed and represented elsewhere in the compression group", in claim 20;

"for each block which does not contain compressed data after said compressing, storing a predetermined block number in the corresponding entry of the compression group, the predetermined block number being indicative that corresponding data is compressed and represented elsewhere in the compression group", in claim 34.

These features, together with the other limitations of the independent claims are novel and non-obvious over the prior art of record. The dependent claims 2-10, 21-30,33,35-38, 40-49 being definite, enabled by the specification, and further limiting to the independent claims are also allowable.

The newly cited reference issued to Ivie, James, WO 2006/063057 published on June 15, 2006 is directed to multiple compression algorithms in database system, more specifically, inter-row compression to be used with fixed-page sizes in a page-based database, when the page data is no longer needed, the compression plug-in compresses the page data using inter-row compression, and passes the compressed page data from the page buffer to the corresponding page, which is fixed in size in substorage [see Abstract], i.e., the compression plug-in identifies if there is sufficient kspace in the page in sub storage to store the data in the page buffer. If there is sufficient space to store the intra-row and inter-row compressed data from the page buffer to the page in sub-storage, the compressed data from the page buffer is saved into the page in the sub-storage. If there is too much data to fit into the page in the sub-storage, the page buffer is split into one or more additional page buffers, as required and one or more corresponding fixed-size pages are also created in the sub-storage.[see page 5, line 20-27, fig 2, fig 4].
